UroFill® Girth Enlargement: A Buyer's Guide

Introduction

Penis girth enhancement (PGE) is a significant decision, and understanding the options available is crucial to making an informed choice. This Buyer's Guide will help you explore the UroFill® technique, compare it to other methods, and understand why it might be the best option for you. ***Beware techniques that are marketed by individuals making false claims without examples found in evidence-based medicine.***

1. Efficacy of the Procedure

UroFill® is a highly effective method for increasing penile girth, with the great majority of patients experiencing significant and satisfying results. The procedure involves injecting hyaluronic acid (HA) into the penile shaft, which provides immediate, significant girth enlargement. Patients can typically expect a girth increase of 1 to 1.5 inches after multiple sessions.

In addition to the added girth, the UroFill® technique can also be used to shape and sculpt the penis to correct defects and enhance its overall appearance. The only staged technique that makes it a fully customizable experience for the patient and their specific needs.

Comparison with Other Methods:

- **Silicone Sleeve Implant:** This technique involves the placement of an inorganic silicone "sleeve" into the shaft of the penis. While "permanent," the procedure comes with the risk of infection, chronic pain, penile disfigurement and more.
- **Autologous Fat Transfer:** Autologous fat transfer moves fat from one part of the body, often by liposuction, into the penis. Results can be unpredictable, and fat may be reabsorbed by the body over time.

- **SILICONE, PLA & PCL Fillers:** These fillers are synthetic, making them less biocompatible than hyaluronic acid. The potential for adverse reactions is higher, and these fillers are not as easily absorbed by the body, leading to possible long-term complications.
BUYER BEWARE
- **HA fillers with Cannula:** The Cannula technique uses HA similar to UroFill® but uses high-risk surgical instruments, typically cannulae, that make it more difficult to control the precise placement of the HA, leading to less than desirable aesthetic results and a higher risk for infection. Results tend to be short lived due to the amount of filler injected during one procedure.

2. Ease of the Procedure

The **UroFill®** penile enlargement procedure is straightforward, minimally invasive, and usually completed within 15 to 30 minutes. Patients report minimal discomfort, which is managed with local anesthesia. The recovery time is short, with most men returning to normal activities within a few days.

Comparison with Other Methods:

- **Silicone Sleeve Implant:** Requires a more invasive surgery with a 4-8 week recovery time.
- **Autologous Fat Transfer:** Requires liposuction and can be more painful with a longer recovery.
- **SILICONE, PLA & PCL Fillers:** Injections can be more painful and involve a longer procedure time.
- **HA fillers with Cannula:** Recovery following cannula-based girth enhancement techniques can take weeks to a month to fully recover from bruising and swelling.

3. Longevity and Maintenance

Hyaluronic acid used in **UroFill®** is naturally gradually absorbed by the body, but some patients experience up to 90% retention at 21 months. Maintenance sessions may be required to sustain the desired girth.

Comparison with Other Methods:

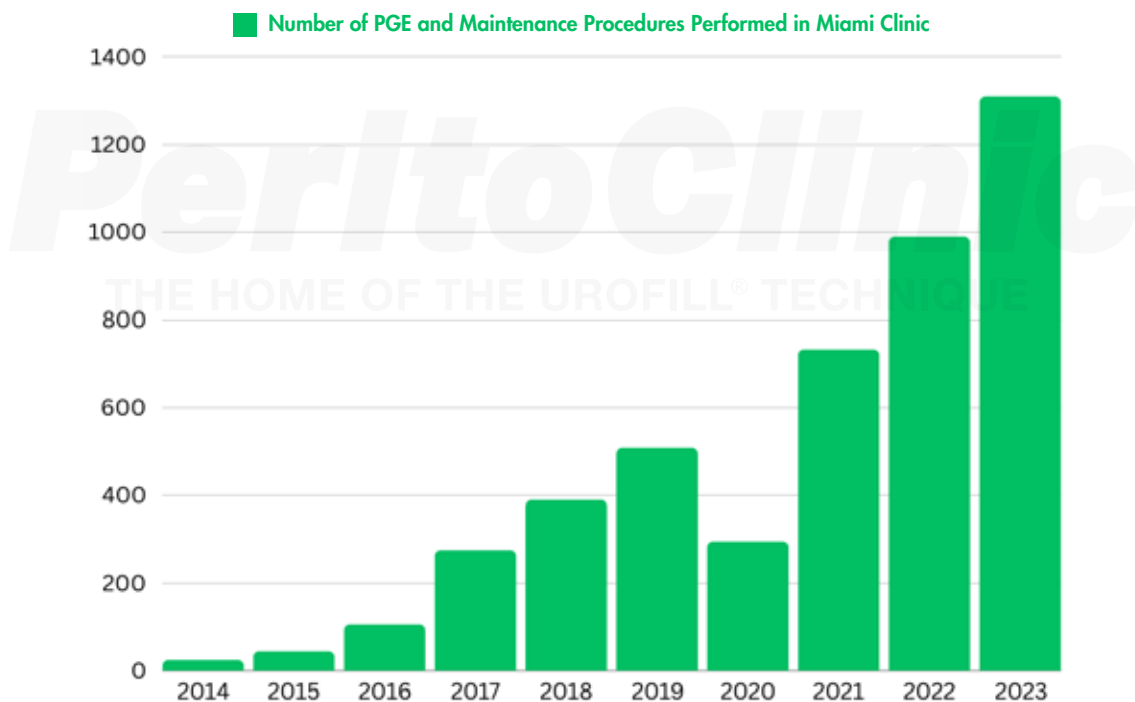

- **Silicone Sleeve Implant:** Permanent, but may require revision surgeries.
- **Autologous Fat Transfer:** Results are less predictable and may require frequent touch-ups.
- **SILICONE, PLA & PCL Fillers:** Inorganic materials that last longer than HA but are less flexible and natural-feeling. These materials are irreversible in some cases, which can lead to penile disfigurement.

- **HA fillers with Cannula:** HA procedures performed with a cannula are not staged, often overloading the penis with filler. This can trigger the body's natural hyaluronidase to break it down quickly, resulting in effects that are short lasting and require multiple sessions for maintenance.

4. Success Rate

UroFill® boasts a high success rate, with most patients achieving their desired results with minimal complications. This is due to UroFill®'s policy of only selecting board-certified urologists to be providers, and nearly ten years of testing and medical data.

Comparison with Other Methods:

- **Silicone Sleeve Implant:** Success varies and depends on the surgeon's expertise. Increased risk of complication significantly reduces patient satisfaction lacking significant scientific data.
- **Autologous Fat Transfer:** Lower success rate due to fat absorption.
- **PLA & PCL Fillers:** Moderate success, with higher risks of complications.

5. Materials Used

UroFill® uses hyaluronic acid, a naturally occurring substance in the body, making it safe, effective, and reversible if needed.

Comparison with Other Methods:

- **Silicone Sleeve Implant:** Made from a synthetic silicone material, which is permanent and non-reversible.
- **Autologous Fat Transfer:** Uses your own fat, which can be reabsorbed and create uneven results.
- **SILICONE, PLA & PCL Fillers:** These are synthetic and can cause more rigidity and complications.

6. Choosing the Right Doctor

Selecting the **right doctor** is crucial to the success of your girth enhancement procedure. The **UroFill®** technique is performed by urologists specially trained by **Dr. Paul Perito**, a world-renowned penile surgeon. Choosing a urologist ensures that your procedure is handled with the utmost expertise and care.

Why a Urologist? Urologists have specialized knowledge of male anatomy and are best-equipped to perform penile procedures safely and effectively. Dr. Perito's reputation and extensive experience make him one of the leading choices for men considering this procedure. Dr. Perito's extensive experience and expertise as a leading penile surgeon make him a top choice for men considering this procedure.

7. Is UroFill® Patented?

Yes, **UroFill®** is a patented technique, meaning it has undergone rigorous evaluation proving its novelty in a realm, to date, that did not have a standardized technique. Such testing and validation is required to ensure its efficacy and safety. The patented process differentiates it from other non-patented fillers, providing peace of mind for patients.

8. Typical Girth Increase

Most patients experience an increase of 1 to 1.5 inches in girth after multiple sessions. The results are natural-looking and feel authentic, providing both aesthetic and functional benefits.

AVERAGE UNITS OF H.A. REQUIRED FOR DESIRED GIRTH

CURRENT PENIS LENGTH

DESIRED PENIS GIRTH

	4 to 5"	5 to 6"	6 to 7"	7 plus"
0.5"	6 to 8 units	8 to 10	10 to 12	12 to 14
1.0"	14 to 16	16 to 20	20 to 24	23 to 28
1.5"	20 to 24	25 to 30	30 to 36	35 to 42
2.0"	28 to 32	34 to 40	40 to 48	46 to 56
2.5"	32 plus	40 plus	48 plus	56 plus

9. Cost Considerations

UroFill® offers flexible pricing based on the number of HA units used. While the initial cost may seem higher, the long-term benefits and safety make it a worthwhile investment. Additionally, financing options are available to help manage the cost.

Comparison with Other Methods:

- **Silicone Sleeve Implant:** Generally more expensive due to the invasive nature of the surgery. PATIENTS MAY INCUR MORE COSTS DUE TO COMPLICATIONS OR REVISION SURGERY
- **Autologous Fat Transfer:** Can be less expensive but may require multiple touch-ups.
- **SILICONE, PLA & PCL Fillers:** Costs vary but are typically on the higher end due to the longevity of the material. COMPLICATIONS COSTLY AND IRREVERSIBLE

10. Competitive Overview

While there are several methods available for penile girth enhancement, **UroFill®** stands out due to its safety, effectiveness, and the expertise of the practitioners. Competitors like Silicone Sleeve, Phallofill, and Androfill offer alternative solutions, but each has its drawbacks, such as invasiveness, higher risks, and less predictable results.

UroFill® vs. The Competition

PENILE GIRTH ENHANCEMENT

UROFILL®	OTHER TECHNIQUES
Launched in 2014 - Proven Success	Launched after 2021 - Unproven
Developed by male sexual health world icon Dr. Paul Perito	Origin unclear
Developed and enhanced during 10+ years of research and practice	Recently developed, unproven
Patented in more than 30 countries	Not Patentend
Developed to enhance male sexual satisfaction and health	Developed to sell more hyaluronic acid
Only performed by experienced, certified urologists	Anyone can perform it (Doctors, Biomedics, Dentists, Pharmacists, Nurses)
Trained and certified by Dr. Perito himself	Trained by random urologists and dermatologists, not standardized
100+ certified urologists worldwide	Recently started training healthcare professionals
5,000 patients worldwide	Recent patient catalogue, if any
HA of choice after more than 15 test HAs: Versa+ 1.2 ml syringe	HA of interest for sales purposes
No cannula or other high risk instruments used	Okay with cannula and other high-risk instruments
100% Urology focused since 2014	100% female aesthetics focused. Entering urology segment in 2021-2024
Natural, pleasing result, fully customizable	Stiff result, not natural to the touch, not customizable
Acknowledged by global medical societies	Not approved or vetted by medical societies

11. Do You Really Need Penis Enlargement Surgery?

Before deciding on any procedure, it's important to evaluate your reasons for seeking penile enlargement. While many men benefit from increased confidence and satisfaction, it's essential to ensure that your expectations are realistic and that you are choosing the procedure for the right reasons.

Conclusion

UroFill® offers a superior solution for men seeking penile girth enhancement. With its minimally invasive procedure, high success rate, and the expertise of world-class urologists like Dr. Perito, **UroFill®** provides a safe, effective, and flexible option for those looking to enhance their size and confidence.
